TODO: a title that names what you did

JPC3 — Improving the Czech Wordnet

TODO: First Author's Name TODO: Second Author's Name

2027-01-31

Abstract

TODO: four or five sentences. What part of the wordnet did you set out to improve, how did you do it (semi-automatically?), how much did you add, and how good was it? Give the headline number here. Write this last.

1 Introduction

TODO: Say which gap in the Czech wordnet you are filling and why it matters. Lead with a concrete example of something that is missing or wrong, not with the literature. State your *numerical goal* up front — the target you agreed at the start — so the reader knows what "done" means.

Here is how you give a numbered example and refer back to it as (1):

(1) TODO: a synset, lemma, or relation that your project adds or fixes.

2 Data and resources

TODO: Name every resource you used — the version of the Czech wordnet, any corpus, lexicon, image set, or model — and give its licence. A reader must be able to get the same inputs you had.

If you quote Czech examples they must be glossed, so that a reader who does not speak Czech can follow. The source line and the gloss line must have the *same number of words*, and matching hyphens, or the columns will not line up:

(2) Czech [ces]
učitel → *učitel-ka*
teacher.M teacher-F
"(male) teacher → (female) teacher"

Name the language on the first line with its ISO 639-3 code in square brackets: Czech `[ces]`, English `[eng]`. Cite the source of any example you did not make up yourself.

3 Previous work

TODO: What have other people done? You need at least three references. Read them — do not cite a paper you have not opened. The two starter readings for your task are in `report.bib`; find the third yourself.

Use `\citet` when the author is part of your sentence, and `\citep` when the citation sits in brackets: Pala and Smrž (2004) built the original Czech wordnet; it is one of many in the Open Multilingual Wordnet (Bond and Foster, 2013).

4 Method and results

TODO: This is the "Extend" part. Describe how you generated the new data — the automatic step and the human step. Be explicit about where the human was in the loop, because that is what makes it *semi*-automatic. Report how much you produced against your goal:

	Goal	Produced
TODO: items added	0	0
TODO: relations added	0	0
TODO: synsets touched	0	0

Table 1: What you set out to do, and what you did.

5 Validation

TODO: This is the heart of the project. Take a *random* sample (aim for at least 500 items) of what you produced and check it by hand. Report precision. Since you work in pairs, report agreement (e.g. Cohen's κ) and say how you resolved disagreements.

The point is not the single number — it is the *categories* of error. Group your mistakes into types, count them, and give one real example of each. The categories are the most interesting thing you will produce; they tell the next team where the method breaks.

Error type	Count	Example
TODO	0	TODO
TODO	0	TODO

Table 2: Error types in a sample of TODO items.

6 Visualisation and explanation

TODO: One figure that makes your change — and its errors — legible to someone who was not in the room. A before/after, a coverage map, a distribution, a sub-graph of the wordnet. Explain what it shows and, if your method made decisions, *why* it decided as it did.

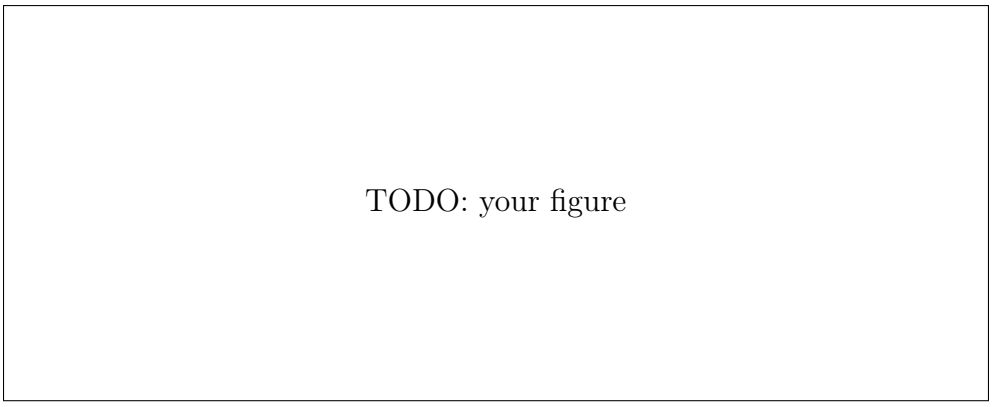

Figure 1: TODO: what the reader should take away from this.

7 Release

TODO: How is your contribution packaged? It should be valid LMF that loads with the `wn` library, with a one-line data statement and the licence. Say where it lives and how someone would install it.

8 Conclusion

TODO: What did you find? Did you hit your number? What did the error analysis reveal, and what should the next team do?

Contribution statement

TODO: Say who did what. A couple of sentences is enough, for example: "A. built the extraction pipeline and wrote Sections 4 and 5; B. did the error analysis and the figure and wrote Sections 1–3; both authors revised the whole paper."

Use of AI tools

TODO: If you used an LLM or other AI tool — as part of the method or to help write — say which, for what, and how you checked its output.
